

Same numeric angle, different reference axis: why the legacy classification fails

(a) Input 55 deg from East: Correct geometry

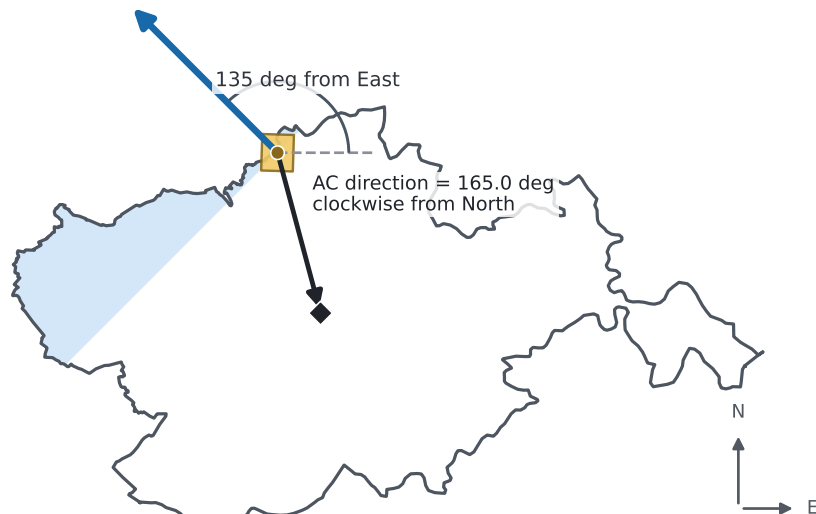

UPWIND | angular separation = 130 deg

(b) Input 55 deg from East: Legacy R interpretation

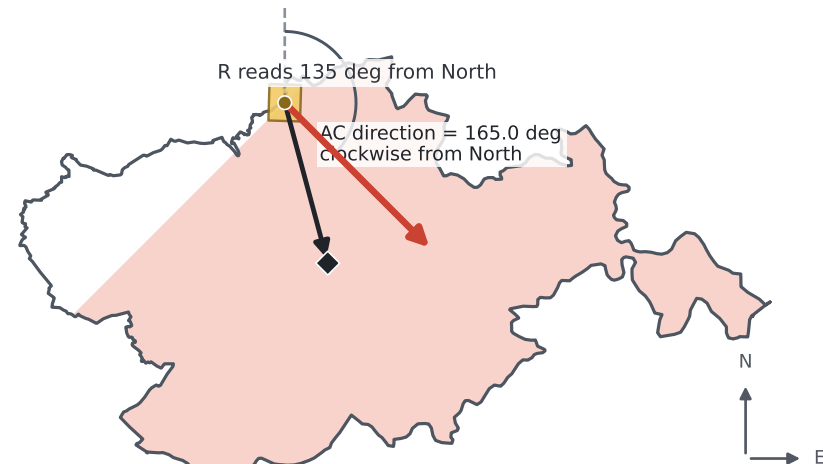

UPWIND | angular separation = 110 deg

(c) Input 135 deg from East: Correct geometry

UPWIND | angular separation = 150 deg

(d) Input 135 deg from East: Legacy R interpretation

DOWNWIND | angular separation = 30 deg

- Correct downwind half of AC
- Legacy-R downwind half of AC
- Selected grid
- AC representative point
- Grid-to-AC direction (165 deg compass)
- Correct wind vector
- Numeric angle misread as compass bearing
